ABSTRACT

A PC (10) has an SSID and a WEP key required for wireless communication with a wireless LAN access point router (30). When the PC (10) has wireless connection with the Internet radio receiver (20) in Ad-Hoc mode, the PC (10) transfers the encrypted SSID and WEP key to the Internet radio receiver (20). The Internet radio receiver (20) decrypts the transferred SSID and WEP key and validates the decrypted SSID and WEP key.
